

AMENDMENT TO THE SPECIFICATION

Please replace the paragraph beginning on page 9, line 22 of the specification with the following marked-up paragraph.

The fan 31 blows relatively cool ambient air through the radiators 28-30 ~~27-29~~ concerned, as a result of which there is a heat transfer between the hot injection liquid in the first radiator 28 [[27]] and the gas mixture to be treated flowing through the second radiator 30 [[29]], such that this gas mixture, as it leaves the compressor installation 2, will be re-heated before being led in the membrane separator 3, and a better output of the membrane separator 3 is obtained.
